DETAILED ACTION

EXAMINER'S AMENDMENT

An examiner's amendment to the record appears below. Should the changes and/or additions be unacceptable to applicant, an amendment may be filed as provided by 37 CFR 1.312. To ensure consideration of such an amendment, it **MUST** be submitted no later than the payment of the issue fee.

Authorization for this examiner's amendment was given in a telephone interview with Chad Billings on 1/8/2007.

The application has been amended as follows:

Please amend line 2 of claim 7 to replace "claim 6" with "claim 1".

Please amend line 13 of claim 8 to replace "portraite" with "portrait".

Please amend line 2 of claim 14 to replace "claim 13" with "claim 8".

Please amend line 15 of claim 15 to replace "portraite" with "portrait".

Allowable Subject Matter

Claims 1-5, 7-12, 14-19 and 21-26 are allowed.

The following is an examiner's statement of reasons for allowance:

Re claim 1, the prior art fails to teach or suggest, "A device and for forming an image of a subject, the device comprising: (a) a focusing lens having an optical axis, with the focusing lens being movable along the optical axis for focusing an image of the subject at an imaging position; (b) a motor connected to the focusing lens, operable for causing the focusing lens to move along the optical axis; (c) an image sensor having a sensing surface located at the imaging position, which produces electronic information in accordance with images on the sensing surface; and (d) a central processing unit electronically connected to the image sensor and receiving electronic information from the image sensor, and electronically connected to and controlling the motor, the central processing unit having a memory and program logic, in which the program logic in accordance with predetermined conditions stored in the memory, the predetermined conditions having been set in advance, determines a starting point of a search of one of two directions of search from the start point for an in-focus position of an image of the subject on the imaging position, and control operation of the motor to move the focusing lens to the start point, and to move the focusing lens from the start point in the

determined direction of search until an in-focus position is reached based on analyzing electronic information received from the image sensor, **wherein the predetermined conditions are photographic modes including at least one of a portrait mode, a close-up mode, a landscape mode and a night scene mode**".

Re claim 8, the prior art fails to teach or suggest, "A focusing method for use in an imaging device for focusing an image of a subject at an imaging position using a focusing lens movable along an optical axis, the method comprising the steps of: (a) determining, in accordance with predetermined conditions, the predetermined conditions having been set in advance, a start point from which to move the focusing lens along the optical axis in searching for an in-focus position and one of two directions of search from the start point; (b) positioning the focusing lens at the start point; and; (c) moving the focusing lens along the optical axis from the start point in the determined direction of search, searching for an in-focus position, **wherein the predetermined conditions are photographic modes including at least one of a portrait mode, a close-up mode, a landscape mode and a night scene mode**".

Re claim 15, the prior art fails to teach or suggest, "A computer program product for using in focusing an image of a subject at an imaging position in an imaging device having a computer, wherein the computer controls movement of a focusing lens along an optical axis, the product comprising a recording medium having recorded thereon electronically readable information which, when used to program the computer, causes

Art Unit: 2622

the computer to: (a) determine, in accordance with predetermined conditions, the predetermined conditions having been set in advance, a start point from which to move the focusing lens along the optical axis in searching for an in-focus position and one of two directions of search from the start point; (b) position the focusing lens at the start point; and; (c) move the focusing lens along the optical axis from the start point in the determined direction of search, searching for an in-focus position, **wherein the predetermined conditions are photographic modes including at least one of a portrait mode, a close-up mode, a landscape mode and a night scene mode**".

Any comments considered necessary by applicant must be submitted no later than the payment of the issue fee and, to avoid processing delays, should preferably accompany the issue fee. Such submissions should be clearly labeled "Comments on Statement of Reasons for Allowance."
